

<p>COUNTRY: INDIA</p> 	<p align="center">SOLAR POWERED IRRIGATION SYSTEMS – COUNTRY CASE STUDY RAJAWAS</p>
	<p>Geographical Location:</p> <ul style="list-style-type: none"> ▪ Rajasthan, Jaipur ▪ Latitude: 24°4'17" N ▪ Longitude: 75°44'10" E ▪ Altitude: 430 m
	<p>Specific Site Conditions:</p> <ul style="list-style-type: none"> ▪ Climatic condition: semi-arid ▪ Remote location, but connected to public grid ▪ Frequent regular load-shedding and irregular voltage fluctuation ▪ Only 6 hours of electricity per day/night ▪ Free-of-charge water is pumped from a drilled well directly into the irrigation system ▪ Good water quality but constantly decreasing and seasonally varying water level in the region
	<p>Salient Features of Solar-powered Irrigation System:</p> <ul style="list-style-type: none"> ▪ 3,1 kW_p PV generator installed on Tata Solar manual tracking system ▪ PV pumping system size is pre-fixed by government ▪ Not well matched PS4000 Lorentz pump/controller – system capacity is not fully exploited ▪ Solar pump mainly serves to bridge periods of lacking grid-electricity ▪ Daily mean water output: 76 m³/day ▪ Pumping Head: 50 m ▪ Conventional impact sprinkler and drip irrigation system in place, but no systematic irrigation outlay, frequent moving of sprinklers/drip lines
	<p>System Costs / Financing:</p> <ul style="list-style-type: none"> ▪ PV pumping system: 5,426 EUR ▪ Irrigation equipment: approx. 900 EUR ▪ Government investment subsidy 70% , own equity of farmer 30% ▪ Farmer pays a flat-rate for grid-electricity of 12 EUR/month
	<p>Farming System / Cropping Patterns:</p> <ul style="list-style-type: none"> ▪ Smallholder farm with 1.2 ha ▪ Main cash crops: wheat, mustard, water melon, green pea ▪ Cereal and oilseed cultivation irrigated with impact sprinklers (2 bar nominal pressure, discharge 2.72 gph, 11.5 m radius), vegetable production on 0,25 ha irrigated by 1/2" drip tube with built-in emitters (turbulent flow, discharge 0.2 gph)
	<p>Experiences / Lessons Learnt:</p> <ul style="list-style-type: none"> ▪ Comparably small PV generator limits potential of the motor/pump => acceptance problems ▪ Standard-type sprinklers, frequently used in India, are not well-suited in combination with capped PV pumps => acceptance problems ▪ Subsidies provided by central / regional government hamper market development ▪ Need for technical training and improvement of locally manufactured components ▪ No structured monitoring of success or failure of programmes
	<p>Promoting and Planning Bodies:</p> <ul style="list-style-type: none"> ▪ 30% investment subsidy by central government + 40% by Rajasthan Horticulture Development Society ▪ Investment subsidy will only be granted if farmer is the land owner and is willing to install water-saving irrigation technology (sprinkler and/or drip) ▪ System integrator: Tata Power Solar
